

RIDGES, VALLEYS, FLASHINGS AND POLYCLOSURES

FLASHINGS

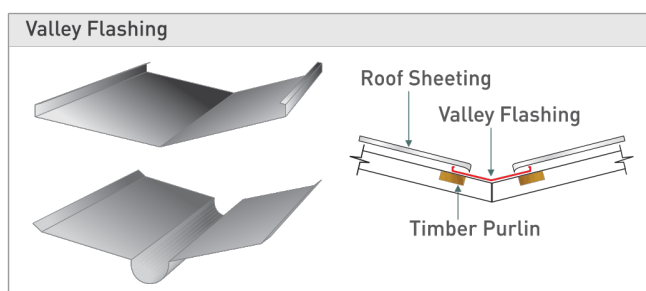

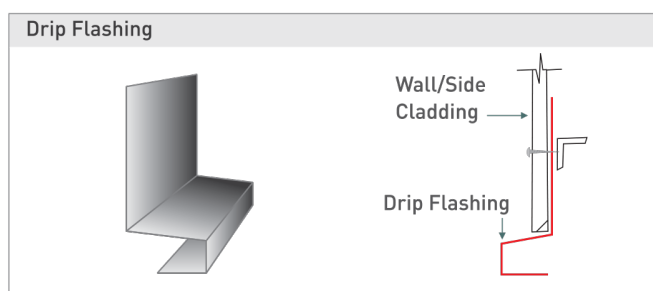

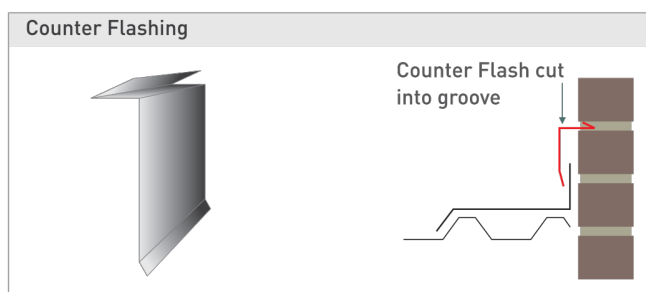

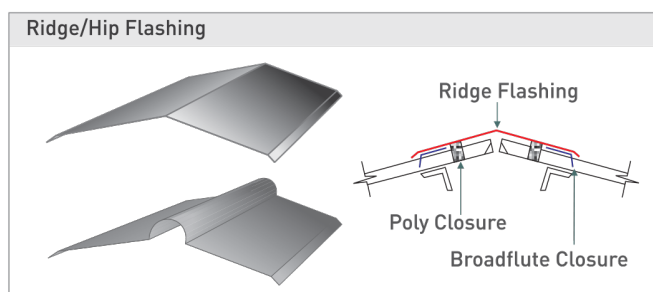

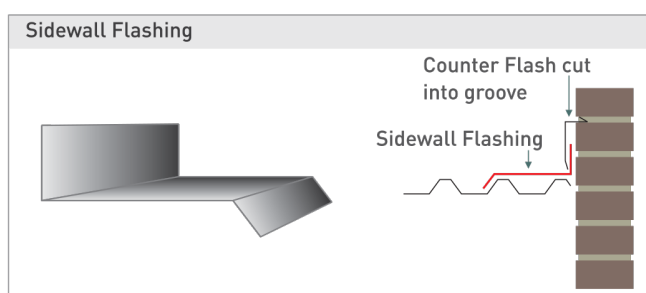

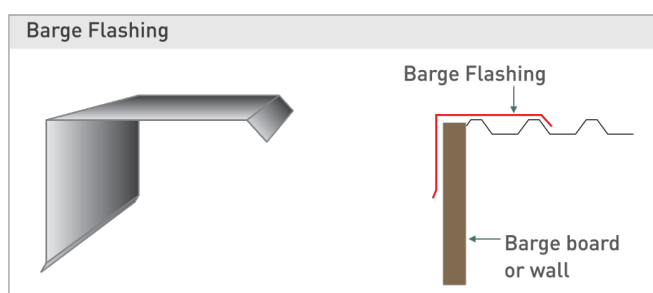

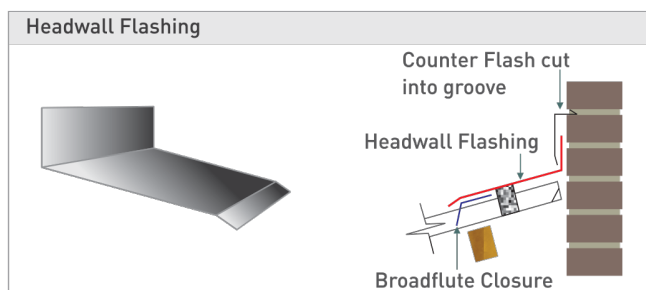

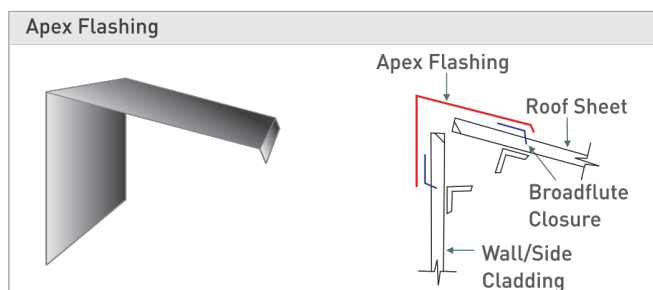

Flashings are made for particular applications and locations on the roof, with variations to suit the specific profile being used. Industrial and commercial flashings tend to be functional more than aesthetic, and ALAF makes a range of standard flashings which are suitable for this purpose.

Residential flashings however, usually have an important aesthetic role which necessitates that they are designed for the structure in question.

ALAF is able to produce most custom designed flashings for residential and other applications- please ask your local branch for more information.

Flashings are usually made in the same material as the roof, for colour matching. ALAF flashings are offered in Aluminium-Zinc coated steel and Aluminium. All counter flashings are sealed with silicone- not cement.

Please speak to our flashings department for further guidance and technical assistance

POLYCLOSURES

Closures form a secure seal where gaps are created by the profile of the sheeting at eaves and ridges. This prevents things such as dust and water from entering your roof space. Our poly closures are made from a closed cell expanded polyethylene foam, meaning they are waterproof weather resistant and dust proof. We have Polyclosures for TEKDEK Profile available.
